

ABSTRACT OF THE DISCLOSURE

Reinforcements (19) bulge out toward the center of a tab insertion opening (14) from corners of an opening edge of the tab insertion opening (14) extending along a partition wall (18) of a connector housing (10). The partition wall (18) is made thicker and stronger by the reinforcements (19). Thus, the partition wall (18) is prevented from damage and/or deformation even if a tab (21a) or the like strikes against the partition wall. The partition wall (18) is made thicker only at the ends of the side edge of the tab insertion opening (14) extending along the partition wall (18). Thus, an opening area of the tab insertion opening (14) still is substantially rectangular and the insertion of the tab (21a) is not hindered.
